

Tolerances and defect exclusion of Soundcomb absorbers

General:

- Angular accuracy of the individual elements: +/- 0.5 degrees
- Horizontal and vertical bending of the outer edges at 1 meter +/- 2mm.
- Soundcomb is a natural product, therefore deviations may occur.
Wood / cellulose / cardboard / corrugated board

Textiles:

- The textiles of the surface covering, or bonding, are made of the "Trevira" fabric and polyester/viscose.
- There are three different Trevira finishes available: Twist, Contour and Hush by the Gabriel company.
- Color fidelity of the surface materials: Refer to the product description of each textile (download)
- Textile corners: Folds and creases may appear after covering
- Textile surfaces: The covering of the textile may wear off after some time. This does not constitute a claim.
- If the textile is bonded, the honeycomb structure may be slightly visible and show through.

Mounting:

- The individual absorbers of our wall-mounted system can be adjusted by up to +/- 2mm.
- There are no adjustment possibilities for our ceiling system.
- The mounting accuracy is provided if a mounting template is used.
